ETHOS ENVIRONMENTAL, INC.
NOTES TO CONDENSED FINANCIAL STATEMENTS

Note 1. Organization and Significant Accounting Policies

Organization

Ethos Environmental, Inc. ("the Company") manufactures and distributes fuel reformulating products that increase fuel mileage, reduce emissions, and maintain lower fuel costs. The Company is based in Southern California and sells its product, primarily in the United States, Latin America, Europe, Africa, Australia and Asia.

Acquisition

On April 20, 2006, Victor Industries, Inc., (Victor) with the approval of its Board of Directors, executed an Agreement and Plan of Merger with San Diego, CA based Ethos Environmental, Inc., a Nevada corporation.

At a meeting of shareholders of the Company held on October 30, 2006, a majority of shareholders voted in favor of the merger. On November 2, 2006, the merger was consummated. As part of the merger, Victor re-domiciled to Nevada, and changed its name to Ethos Environmental, Inc. In addition thereto, and as part of the merger, the Company set a record date of November 16, 2006 for a reverse stock split of 1 for 1,200. All of the per share data in these condensed financial statements are presented on a post-split basis.

The merger provided for a business combination transaction by means of a merger of Ethos with and into Victor, with the Company as the corporation surviving the merger. Accordingly, the comparative information presented is that of Ethos Environmental, Inc.

Going Concern

The Company has incurred significant losses from operations in the last two years, and as of September 30, 2007 the Company has an accumulated deficit of \$18,932,444. The cumulative net losses incurred for the year ended December 31, 2006 and for the nine months ended September 30, 2007 of \$9,065,867 are mainly due to non-cash transactions for issuance of stock for services and loss on impairment of building (see Stock Based Compensation, following).

Management of the Company has undertaken steps as part of a plan with the goal of sustaining the Company operations for the next twelve months and beyond. These steps include: (a) attempting to raise additional capital and/or other forms of financing; (b) controlling overhead and operating expenses; and (c) continuing to increase the sales of its fuel reformulating product. There can be no assurance that any of these efforts will be successful.

Basis of Presentation

The accompanying condensed financial statements have been prepared by the Company pursuant to the rules and regulations of the U.S. Securities and Exchange Commission ("SEC"). Certain information and footnote disclosure normally included in financial statements prepared in accordance with accounting principles generally accepted in the United States have been condensed or omitted pursuant to such SEC rules and regulations. The interim period condensed financial statements should be read together with the audited financial statements and accompanying notes for the years ended December 31, 2006 and 2005, included in the Company's annual reports on Form 10-KSB. In the opinion of management, the unaudited condensed financial statements contained herein contain all adjustments necessary (consisting of a normal recurring nature) to present a fair statement of the results of the interim periods

presented.

Table of Contents

9

The results of operations for the three and nine months ended September 30, 2007, are not necessarily indicative of the results to be expected for the entire year ending December 31, 2007.

Use of Estimates

The preparation of financial statements in conformity with accounting principles generally accepted in the United States requires management to make estimates and assumptions that affect certain reported amounts and disclosures. Actual results could differ from the estimated amounts.

Major Customers

Three customers accounted for 88% of revenue for the three months and nine months ended September 30, 2007. The same three customers accounted for 90% of receivables as of September 30, 2007. Two customers accounted for 88% of revenue for the three and nine months ended September 30, 2006.

Stock Based Compensation

The Company accounts for stock-based awards in accordance with Statement of Financial Accounting Standards ("SFAS") No. 123(R) "Share-Based Payment", which requires measurement of compensation cost for all stock-based awards at fair value on the date of grant and recognition of compensation over the service period for awards expected to vest. The fair value of stock options is determined using the Black-Scholes valuation model, which is consistent with the Company's valuation techniques previously utilized for options in footnote disclosures required under SFAS No. 123, "Accounting for Stock-Based Compensation", as amended by SFAS No. 148, "Accounting for Stock-Based Compensation Transition and Disclosure".

During the three months ended March 31, 2007, the company issued 468,000 shares of common stock. Of this total, 368,000 shares of common stock were issued for services, and 100,000 shares were issued in compliance with the Employment Agreement of Thomas W. Maher, Chief Financial Officer. The Employment Agreement was filed along with Form 8-K submitted to the SEC on December 8, 2006. These shares of stock were valued at the fair value at date of issuance for \$4.54 and \$5.00, respectively, and are included in general and administrative expenses.

During the three months ended June 30, 2007, the company issued 483,500 shares of common stock and retired 250,000 shares of common stock. The shares issued were for services and were valued at the fair value at date of issuance for approximately \$3.95, and included in general and administrative expenses. There was no cash involved in these transactions.

During the three months ended September 30, 2007, the company issued 2,500,000 shares of common stock for cash in the amount of \$2,000,000, and for impairment of the building asset in the amount of \$1,550,000. As part of this transaction, the building was sold to a third party for \$7,875,000 of which \$2,000,000 was allocated to the shares mentioned above. The remaining \$5,875,000 was allocated to the building sale, which was settled on October 25, 2007(See Assets held for sale).

Income Taxes

The Company accounts for its income taxes under the provisions of Statements of Financial Accounting Standards No. 109 (SFAS No. 109). Income taxes are provided for the tax effects of transactions reported in the financial statements and consist of taxes currently due plus deferred taxes related primarily to differences between the bases of certain assets and liabilities for financial and tax reporting. Deferred taxes represent the future tax return consequences of those differences, which will either be taxable or deductible when the assets and liabilities are recovered or settled. No provision for deferred taxes is reflected in the financial statements as the valuation allowance offsets any deferred

tax benefit.

Table of Contents

10

The Company is liable for taxes in the United States. As of September 30, 2007, the Company does not expect to have any income for tax purposes and therefore, no tax liability or expense has been recorded in these condensed financial statements, except for the minimum tax in California amounting to \$800.

The Company estimates that it has tax losses of approximately \$18,925,000 which may be available to reduce future taxable income. Any tax loss carry forwards available expire between the years 2020 and 2026.

The deferred tax asset associated with the estimated tax loss carry forward is approximately \$7,500,000. The Company has provided for a valuation allowance as an offset against the deferred tax asset as it is unknown at this time if the asset will be utilized. Deferred tax assets must be reduced by a valuation allowance if, based upon the weight of available evidence, it is more likely than not that some portion or all of the benefit will not be realized. The Company has taken a conservative approach in that it is unknown at this time if the tax benefit from these net operating losses will ever be realized. Therefore, the entire amount of the deferred tax benefit has been reduced by a valuation allowance equal to the tax benefit.

Assets held for sale

Management considers an asset held for sale when the following criteria per SFAS No. 144 "Accounting for the Impairment or Disposal of Long-Lived Assets" ("SFAS 144") are met:

- a. Management commits to a plan to sell the asset;
- b. The asset is available for immediate sale in its present condition;
- c. An active marketing plan to sell the asset has been initiated at a reasonable price;
- d. The sale of the asset is probable within one year; and,
- e. It is unlikely that significant changes to the plan to sell the asset will be made.

Upon designation of a property as an asset held for sale, and in accordance with the provisions of SFAS 144, the Company records the carrying value or its estimated fair value, less estimated selling costs, and the Company ceases depreciating the assets. (See Note 4).

Earnings (Loss) Per Share

Basic earnings (loss) per share is computed by dividing the net income (loss) available to common shareholders by the weighted average number of common shares outstanding in the period. Diluted earnings per share takes into consideration common shares outstanding (computed under basic earnings per share) and potentially dilutive common shares. There were 1,900,000 warrants outstanding at September 30, 2007 which is not included in the earnings per share calculation since their effect would be antidilutive due to the Company's net loss. There were no dilutive instruments outstanding in 2006.

Note 2. Debt Extinguishment

On May 23, 2007 the Company amended the loan agreement for the financing of its building by extending the maturity date to March 31, 2009, from the original maturity date of January 26, 2007, and rescinding the convertible feature. Due to the substantial modification of the agreement, the original loan is considered extinguished and a new note was issued. In addition to the new note, the Company issued the lender as consideration for the modified loan terms a warrant for purchase of 1,900,000 shares of its common stock with an exercise price of \$2.50 per share. This warrant expires on March 31, 2010. The fair value of the warrant was determined using the Black-Scholes valuation model. The assumptions included an estimated term of three years, volatility of 383%, discount rate of 8.25% and a dividend rate of 0%. The resulting fair value of the warrant totaled \$6,646,171, which has been included in the loss on debt extinguishment in the Company's condensed statement of operations for the nine months ended September 30, 2007.

Table of Contents

11

Note 3. Inventory

Inventory consists primarily of the Company's fuel reformulating product and is stated at the lower of cost or market. The Company accounts for its inventory on a first-in-first-out basis (FIFO).

At September 30, 2007, inventory is made up of raw materials and finished goods as shown below:

Raw Materials	\$ 23,186
Finished Goods	<u>122,812</u>
Total Inventory	<u>\$145,998</u>

Note 4. Assets held for sale

Subsequent to September 30, 2007, the Company sold the building which serves as its main facility. The property went into escrow on August 7, 2007 and the transaction was completed on October 25, 2007. Included with the sale of the building was an issuance for cash of 2,500,000 shares of common stock which was realized during the three months ended September 30, 2007.

The assets held for sale at September 30, 2007 are separately disclosed in the accompanying condensed balance sheet. The Company realized a loss impairment on the building in the amount of \$1,550,000, which is the difference between the stock issuance price and the cash received on August 7 (See Note 10- Subsequent Events). The amount the Company will ultimately realize on these assets could differ from the amount recorded in the condensed financial statements.

Note 5. Sale and Leaseback

On February 7, 2007, the Company entered into an equipment lease agreement with Mazuma Capital Corp. wherein the Company agreed to a 24-month sale and leaseback arrangement for up to \$800,000 of its manufacturing equipment. The lease calls for a monthly payment based on a factor of .04125 times the average outstanding loan balance during the month. Through August 20, 2007, the company had placed property valued at \$737,968 under this lease arrangement with Mazuma Capital Corp.

The contract for this sale and leaseback of equipment was accounted for as an operating lease per SFAS 13 and 28. There is no bargain purchase option at the end of the lease, and neither the 75% nor the 90% test has been met. The title may pass back to the Company at the end of the lease; however, the lease may also be continued at the end of the 24 month period or the equipment retained by the lessor. The Company feels the appropriate stance is to show this as an operating lease in 2007; thereby recording the reduction of equipment, the corresponding gain, and treating the payments as lease expense.

Note 6. Related Party Transactions

There were advances from the CEO to the Company during the nine month period ended September 30, 2007. At September 30, 2007 and 2006, the advances owed to the CEO totaled \$115,124 and -0-, respectively.

Note 7. Off Balance Sheet Arrangements

The Company does not have any off-balance sheet arrangements that have or are reasonably likely to have a current or future effect on our financial condition, changes in financial condition, revenues or expenses, results of operations, liquidity, capital expenditures or capital resources that are material to our investors.

Note 8. Litigation

During the nine months ended September 30, 2007, ACCUTEK, Inc. filed a lawsuit against the Company seeking \$60,000 in damages. The Company has filed its answer, including various counter claims against ACCUTEK, Inc., including breach of contractual obligations. There are two other smaller claims against the Company seeking damages in aggregate of approximately \$24,000. Management has accrued what they believe to be the appropriate amount representing any potential loss.

Table of Contents

12

Note 9. Recent Accounting Pronouncements

On January 1, 2007, the Company adopted the provisions of Financial Accounting Standards Board Interpretation Number 48 (“*FIN 48*”), “*Accounting for Uncertainty in Income Taxes - an interpretation of FASB Statement 109*”. *FIN 48* supplements FASB 109, “*Accounting for Income Taxes*”, by defining the confidence level that a tax position must meet in order to be recognized in the financial statements. *FIN 48* prescribes a comprehensive model for how a Company should recognize, measure, present and disclose in its financial statements uncertain tax positions that the enterprise has taken or expects to take on the tax return. *FIN 48* requires that the tax effects of a position be recognized only if it is “*more likely than not*” to be sustained based solely on its technical merits. Management must be able to conclude that the tax law, regulations, case law and other objective information regarding the technical merits sufficiently support the position’s sustainability with a likelihood of more than 50 percent. *FIN 48* also provides guidance on derecognition, classification, interest and penalties, accounting in interim periods, disclosure and transition. *FIN 48* is effective for fiscal years beginning after December 15, 2006. The Company’s evaluation is in process for the tax years ended December, 2004, 2005, 2006, the tax periods which remain subject to examination by major tax jurisdictions.

Note 10. Subsequent Events

On or about August 7, 2007, the Company entered into an agreement to sell the land and building located at 6800 Gateway Park Drive located in San Diego, CA, as well as 2,500,000 shares of its common stock in exchange for \$7,875,000. The Company received \$2,000,000 for the 2,500,000 shares of stock during this current period. The remaining \$5,875,000 is allocated for the sale of the building. The Company completed the sale of the building on October 25, 2007. At September 30, 2007, the Company is showing a loss on building impairment of \$1,550,000 which is the difference between the par value of the stock and the fair market value at date of issuance. The Company’s Form 8-K filed on or about August 10, 2007 is incorporated by reference herein and provides additional details regarding this transaction. With the completion of the sale the Company paid off the accompanying Mortgage and the Current Portion of Long Term Debt.

Subsequent to September 30, 2007, the Company has issued 562,500 shares of its common stock for consulting, legal, and business services.

ITEM 2. MANAGEMENT'S DISCUSSION AND ANALYSIS AND PLAN OF OPERATION

This discussion and analysis should be read in conjunction with the accompanying Financial Statements and related notes. Our discussion and analysis of our financial condition and results of operations are based upon our financial statements, which have been prepared in accordance with accounting principles generally accepted in the United States. The preparation of financial statements in conformity with accounting principles generally accepted in the United States of America requires us to make estimates and assumptions that affect the reported amounts of assets and liabilities, disclosure of any contingent liabilities at the financial statement date and reported amounts of revenue and expenses during the reporting period. On an on-going basis we review our estimates and assumptions. Our estimates are based on our historical experience and other assumptions that we believe to be reasonable under the circumstances. Actual results are likely to differ from those estimates under different assumptions or conditions, but we do not believe such differences will materially affect our financial position or results of operations. Our critical accounting policies, the policies we believe are most important to the presentation of our financial statements and require the most difficult, subjective and complex judgments, are outlined below in "Critical Accounting Policies," and have not changed significantly.

In addition, certain statements made in this report may constitute "forward-looking statements". These forward-looking statements involve known or unknown risks, uncertainties and other factors that may cause the actual results, performance, or achievements of the Company to be materially different from any future results, performance or achievements expressed or implied by the forward-looking statements. Specifically, 1) our ability to obtain necessary regulatory approvals for our products; and 2) our ability to increase revenues and operating income, is dependent upon our ability to develop and sell our products, general economic conditions, and other factors. You can identify forward-looking statements by terminology such as "may," "will," "should," "expects," "intends," "plans," "anticipates," "believes," "estimates," "predicts," "potential," "continues" or the negative of these terms or other comparable terminology. Although we believe that the expectations reflected in the forward-looking statements are reasonable, we cannot guarantee future results, levels of activity, performance or achievements.

The Company and Our Business

Ethos Environmental, Inc. ("*Ethos*" or the "*Company*") manufactures and distributes fuel reformulating products designed to enable fuels to burn cleaner. The products developed by the Company are proprietary and, as such, protected by the Uniform Trade Secrets Act. Our products, distributed using our registered trademark, *Ethos FR*[®], are comprised of a unique line of fuel reformulators that consist of a blend of high quality, non-toxic, non-petroleum based esters.

Ethos products are non-toxic, non-hazardous and work with any fuel and in both internal and external combustion engines, which includes cars, trucks, buses, RV's, ships, trains and generators. Ethos products reduce fuel costs by producing a net gain in mileage above cost. Our products contain two families of esters, a group of cleaning esters and a group of lubricating esters, both of which are combined with a mineral oil base. Our products serve to clean and lubricate the internal parts of an engine without the use of petroleum-derived products commonly found in fuel additives. The main objective is to make fuels self-cleaning and self-lubricating without increasing toxic emissions. Importantly, since moving parts function more smoothly with reduced heat and friction, less engine maintenance is required and horsepower returns closer to the manufacturer specifications. Ethos products remove carbon deposits, one of the culprits that cause fuel to combust incompletely, resulting in wasted fuel that creates toxic emissions. The combination of cleaning and lubricating esters in Ethos products serve to stabilize fuel without changing its formula or specifications.

Overall, our products make engines combust fuel more completely. When an engine uses each measure of fuel to the maximum degree possible, it has two very important benefits. First, it reduces fuel consumption and reduces non-combusted residues that an engine expels in the form of exhaust emissions, such as hydrocarbons, nitrogen

oxides, carbon monoxide, particulate matter and other harmful products of combustion. Next, unused fuel is saved in the fuel tank, waiting to be used efficiently by the engine, instead of exhausted in the form of toxic emissions. Ethos products reduce emissions without adding any of its own components to the exhaust. EPA Laboratory tests confirm that Ethos FR[®] is 99.99976% clean upon ignition and ashless upon combustion.

Table of Contents

14

Ethos seeks both a cleaner environment and economic success. As the name Ethos suggests, we are committed to the highest ethical standards - in the product that we sell, in the relationship with our clients, and in the conduct of our business. The Company's approach to sales is "one gallon at a time," earning the trust and loyalty of each customer by providing products that perform as promised and make a positive difference in the world.

Overview

The mission of Ethos Environmental is to be recognized as the industry standard for high quality, non-toxic cleaning and lubricating products that increase fuel mileage and reduce emissions.

Ethos' customers exist everywhere that budgets are affected by the rising cost of fuel and where solutions are sought for the pervasive ills of air pollution. Our customers are motivated both by cost savings and environmental concerns, and it is our mission to provide products to meet their needs, risk free, and at an economic gain to every client.

The management of Ethos Environmental firmly believes that the market for our product is aggressively expanding. Worldwide fuel consumption is approximately 85 million barrels per day and projected by the Energy Information Administration to continue to grow to 97 million barrels per day by 2015, and 118 million barrels per day by 2030. Much of the dramatic growth over the past decade has been fueled by the dramatic expansion of India, China and Brazil. As additional undeveloped countries begin to expand, so too will fuel consumption and the Company's market base. In addition, consumers are becoming more sensitive to increased fuel economy as oil prices have increased eight times since the late 1990s.

It is our goal to continue to aggressively build on our success in the domestic and international markets, offering the benefits of our products to companies and countries around the world. During 2006, our revenue base increased by 168% over 2005. Since 2004, the company has increased its revenue base by 450%, and by 573% since 2003. In the second quarter of 2007, sales increased by 88% over the same quarter from one year prior.

The company's management is directed to continued growth with its attention focused on comparative savings in marketing and production costs. Our attention going forward is to increase market awareness of our name and the benefits provided by our product line.

During 2007, the company will be directing concerted focus to full compliance with Sarbanes-Oxley requirements, as revised in Audit Standard No. 5 for small businesses, in implementing Section 404(a) of the Act.

Business Summary

The mission of Ethos Environmental is to be recognized as the industry standard for high quality, non-toxic cleaning and lubricating products that increase fuel mileage and reduce these ecologically damaging emissions from vehicles, and at a price everyone can afford. The goal of the company is to make the world a better place, "one gallon at a time". According to the Environmental Protection Agency (EPA), "The burning of fuels releases carbon dioxide (CO₂) into the atmosphere and contributes to climate change [Global Warming], but these emissions can be reduced by improving your car's fuel efficiency." Air pollution caused by cars, trucks and other vehicles burning petroleum-based fuels is one of the most harmful and ubiquitous environmental problems. Furthermore, local accumulation in heavy traffic is the greatest source of community ambient exposure, largely because carbon monoxide is formed by incomplete combustion of carbon containing fuels.

Ethos Environmental manufactures and distributes a unique line of fuel reformulators that contain a blend of low and high molecular weight esters. The product adds cleaning and lubrication qualities to any type of fuel or motor oil. The overall benefits are increased fuel mileage, reduced emissions and reduced maintenance costs as the product allows engines to perform cooler, smoother and with more vigor.

Esters

In the simplest terms, esters can be defined as the reaction products of acids and alcohols. Thousands of different kinds of esters are commercially produced for a broad range of applications. Within the realm of synthetic lubrication, a relatively small substantial family of esters have been found to be very useful in severe environment applications.

Esters lubricants have already captured certain niches in the industrial market such as reciprocating air compressors and high temperature industrial oven chain lubricants. When one focuses on high temperature extremes and their telltale signs such as smoking, wear, and deposits, the potential applications for the problem solving ester lubricants are virtually endless.

In many ways esters are very similar to the more commonly known and used synthetic hydrocarbons or PAOs. Like PAOs, esters are synthesized from relatively pure and simple starting materials to produce predetermined molecular structures designed specifically for high performance lubrication. Both types of synthetic base stocks are primarily branched hydrocarbons which are thermally and oxidatively stable, have high viscosity indices, and lack the undesirable and unstable impurities found in conventional petroleum based oils. The primary structural difference between esters and PAOs is the presence of multiple ester linkages (COOR) in esters which impart polarity to the molecules. This polarity affects the way esters behave as lubricants in the following ways:

Volatility: The polarity of the ester molecules causes them to be attracted to one another and this intermolecular attraction requires more energy (heat) for the esters to transfer from a liquid to a gaseous state. Therefore, at a given molecular weight or viscosity, the esters will exhibit a lower vapor pressure which translates into a higher flash point and a lower rate of evaporation for the lubricant. Generally speaking, the more ester linkages in a specific ester the higher its flash point and the lower its volatility.

Lubricity: Polarity also causes the ester molecules to be attracted to positively charged metal surfaces. As a result, the molecules tend to line up on the metal surface creating a film which requires additional energy (load) to penetrate. The result is a stronger film which translates into higher lubricity and lower energy consumption on lubricant applications.

Detergency/Dispersency: The polar nature of esters also makes them good solvents and dispersants. This allows the esters to solubilize or disperse oil degradation by-products which might otherwise be deposited as varnish or sludge, and translates into cleaner operation and improved additive solubility in the final lubricant.

Biodegradability: While stable against oxidative and thermal breakdown, the ester linkage provides a vulnerable site for microbes to begin their work of biodegrading the ester molecule. This translates into very high biodegradability rates for ester lubricants and allows more environmentally friendly products to be formulated.

Ethos Environmental manufactures and distributes Ethos FR, a unique combination of high-quality, non-toxic, specially designed esters that uses only the elements of carbon, hydrogen and oxygen. It significantly reduces emissions, fuel consumption, and engine maintenance costs. Ethos FR provides an immediate, cost-effective strategy for fighting air pollution caused by fossil fuels and the internal combustion engine. This combination of low molecular cleaning esters and the high molecular lubricating esters, reformulates any fuel whether it's gasoline, diesel, methanol, ethanol, LNG, compressed natural gas or bio-diesel. When blended with fuels, Ethos FR reduces the emissions of hydrocarbons (HC), nitrogen oxides (NO_x), carbon monoxide (CO), particulate matter (PM) and other harmful products of combustion. Yet, the emission of O₂ is significantly increased. An EPA registered laboratory, confirms that Ethos FR is 99.99976% clean upon ignition and ashless upon combustion. Ethos FR is free of carcinogens.

Ethos FR is a light colored, multi-functional fuel reformulator. It is designed for use in all fuels to increase power and mileage, dissolve gums and varnishes, lubricate upper cylinder components and keep the entire fuel system clean and highly lubricated. It is recommended for use at 1 part in 1280, which is equal to 1 fluid ounce of Ethos FR per 10

gallons of fuel.

Table of Contents

16

Typical Specifications

Tests	Results
Viscosity @ 37.8° C,CS	10.39
Viscosity @ 100° F, SSU	60.2
Specific Gravity @ 15.6/15.6°C	0.93
API Gravity Degrees	26.6
Flash Point, COC, °C (°F)	149°C (300°F)
Color and Appearance	Light, bright and clear
Sediment	None

Ethos Environmental offers a cost-effective solution to relieve skyrocketing fuel prices and help lessen environmental regulatory pressures. Ethos products address one problem that has two side effects, wasted fuel and air pollution. Fuel burns inefficiently in an internal combustion engine and that inefficiency leads to wasted fuel transformed into toxic emissions. Ethos products make fuel burn more efficiently so it significantly improves both of the aforementioned adverse effects. Most important, the use of Ethos results in fuel cost savings to the customer.

Fuel and Maintenance Costs Savings:

- Increases Miles-Per-Gallon between 7% and 19% Fleet-Wide
- Enhances Engine Performance by Reducing Heat Produced by Friction

Fines and Downtime are Reduced Due To Air Pollution:

- Reduces Toxic Emissions By 30% or More
- Free Of Carcinogens
- Non-Toxic & Non-Hazardous
- Not a Petrochemical
- 99.99976% Ashless upon Combustion

Repairs:

- Improves Combustion
- Cleans Fuel System
- Lubricates Moving Components
- Extends Engine Life by Reducing Friction

How Do Ethos Products Work?

Ethos products reformulate any fuel, resulting in two important benefits. The first benefit is the added lubricity to the engine. The second is adding cleansing properties to the fuel. All of the internal components benefit from the cleansing and lubricating action including the fuel lines, filters, carburetors, spark plugs and injectors. Ethos also conditions the engine seals, keeping them tighter for a longer period of time. A cleaner, more lubricated engine runs smoother, requires less maintenance and reduces engine heat significantly, thereby returning horsepower closer to the

manufacturer's specifications. Ethos removes carbon deposits that cause fuel to combust incompletely, resulting in wasted fuel that creates toxic emissions. The combination of cleaning and lubricating esters in our products stabilize the fuel without changing its specifications.

In Ethos FR®, for example, a group of low molecular weight esters clean the dirty deposits formed by fuels and the combustion process. These deposits lower performance of an engine making it less fuel-efficient. Causing it to exhaust raw fuel, which is the primary contributor to pollution. A group of high molecular weight esters lubricate the engine surfaces as the fuel runs through it. Their molecular structure is small enough to penetrate the metal and form a lubricating layer between surfaces. This process allows the moving components of an engine to operate smoother and with less power-robbing friction and heat.

Table of Contents

17

The primary task for the Company is to distinguish itself as an industry leader in the reduction of fuel costs and emission problems at a profit gain to the commercial user. Part of the challenge before us is to differentiate Ethos products from two types of products in this industry, additives - that are purported to increase fuel mileage and oxygenates - which are mandated to lower emissions. Both additives and oxygenates provide short-term benefits at the price of long-term engine or environmental problems.

Additives contain highly refined petrochemicals or compressed hydrocarbons that promise better fuel mileage and sometimes lower emissions, by “cleaning” the engine. Used mainly by individual consumers, they are expensive and commonly sold at the auto parts and retail stores. More than five thousand EPA-registered fuel additives compete in the retail market and although the EPA requires that such products be registered, that registration constitutes neither endorsement nor validation of the product’s claims.

Oxygenates, such as methyl tertiary butyl ether (MTBE) and Ethanol, are intended to lower emissions by adding oxygen to the fuel. Ethos FR[®] products actually complement federally mandated oxygenates by lowering emissions, but as mentioned earlier, Ethos FR[®] is not an oxygenate and cannot be used for the purpose of complying with current language federal legislation.

In contrast, Ethos products have cleaning properties that contribute to the lubrication of the engine instead of destroying it. The ester-based formula dissolves the gums and residues and adds important lubrication that an engine needs. The engine stays clean and lubricated, allowing it to run smoothly and efficiently.

Both E85 and biodiesel, such as B5, are alternative measures currently being considered for use by the federal government. However, these alternative measures rely entirely on agricultural resources such as corn, barley, wheat and vegetable oils. Realistically, the agricultural sector of the economy cannot hope to produce sufficient quantities of these products to cause an appreciable effect on global warming. This is a problem not facing Ethos as the product is readily available and continuously produced at a lower price.

While the debate on emissions reduction solutions continues, Ethos Environmental is making a difference in cleaning the air today while reducing fuel costs to its customers. Extensive road tests with Ethos FR[®] have proven that commercial fleets, on average, increase fuel mileage between 7% and 19% and reduce emissions by more than 30%. Ethos FR[®] is non-toxic, non-hazardous and works with any fuel used in cars, trucks, buses, RV’s, ships, trains and generators.

The overall result is that Ethos FR[®] makes engines combust fuel more efficiently. When an engine uses each measure of fuel to the maximum degree possible, it has two very important benefits. It reduces fuel consumption and reduces non-combusted residues that an engine expels in the form of exhaust emissions such as hydrocarbons, nitrogen oxides, carbon monoxide, particulate matter and other harmful products of combustion. Unused fuel is saved in the fuel tank, waiting to be used efficiently by the engine, instead of exhausted in the form of toxic emissions. Ethos FR[®] reduces emissions without adding any of its own components to the exhaust since it is 99.99976% ash-less upon combustion, and free of carcinogenic compounds.

Ethos Environmental is also at the forefront in the development of new blending methods and is positioned to become an industry leader with new products currently under development.

Our Corporate History

We were originally incorporated under the laws of the State of Idaho on January 19, 1926 under the name of Omo Mining and Leasing Corporation. The Company was renamed Omo Mines Corporation on January 19, 1929. The name was changed again on November 14, 1936 to Kaslo Mines Corporation and finally Victor Industries, Inc. on December 24, 1977.

As Victor Industries, Inc., the Company developed, manufactured, and marketed products related to the use of the mineral known as zeolite. Zeolites have the unique distinction of being nature's only negatively charged mineral. Zeolites are useful for metal and toxic chemical absorbents, water softeners, gas absorbents, radiation absorbents and soil and fertilizer amendments.

18

Reverse Acquisition of Ethos

On November 2, 2006, as part of a two-step reverse merger, the Company merged with and into Victor Nevada, Inc. a newly incorporated entity for the purpose of redomiciling under the laws of the State of Nevada. Concurrently therewith, we completed the merger transaction with Ethos Environmental, Inc., a privately held Nevada corporation "Ethos". The Company was the surviving entity. To more adequately reflect the new direction of the Company, the name was changed to Ethos Environmental, Inc. and the Company adopted the business plan of Ethos.

Acquisition

On April 20, 2006, Victor Industries, Inc., with the approval of its Board of Directors, executed an Agreement and Plan of Merger with San Diego, CA based Ethos Environmental, Inc., a Nevada corporation.

At a meeting of the shareholders of the Company held on October 30, 2006, a majority of shareholders voted in favor of the merger. On November 2, 2006, the merger was consummated. As part of the merger, the Company redomiciled to Nevada, and changed its name to Ethos Environmental, Inc. In addition thereto, and as part of the merger, the Company set a record date of November 16, 2006 for a reverse stock split of 1 for 1,200.

The merger provides for a business combination transaction by means of a merger of Ethos with and into the Company, with the Company as the corporation surviving the merger. Under the terms of the merger, the Company acquired all issued and outstanding shares of Ethos in exchange for 17,718,187 shares of common stock of the Company. Shares of Company common stock, representing an estimated 97% of the total issued and outstanding shares of Company common stock, was issued to the Ethos stockholders. Ethos shareholders were able to exchange their shares beginning on or after November 16, 2006, the record date set for the reverse stock split.

The shares issued by the registrant (17,718,187) were revalued at the new par value of \$.0001. Another adjustment to common stock and additional paid in capital was generated due to the cancellation of pre-merger shares (17,717,477). Due to the effect of the reverse merger, the Buyer's shares outstanding (479,500) were converted to common stock and the effect of the net assets acquired was adjusted to additional paid in capital. During the year, another 4,910,000 shares of common stock were issued for services based upon the price at date of issuance.

The merger was intended to qualify as a reorganization within the meaning of Section 368(a) of the Internal Revenue Code and no gain or loss will be recognized by the Company as a result of the merger.

The merger is accounted for under the purchase method of accounting as a reverse acquisition in accordance with U.S. generally accepted accounting principles for accounting and financial reporting purposes. Under this method of accounting, Ethos is treated as the "accounting acquirer" for financial reporting purposes. In accordance with guidance applicable to these circumstances, the merger was considered to be a capital transaction in substance. Accordingly, for accounting purposes, the merger was treated as the equivalent of Ethos issuing stock for the net monetary assets of the Company. The net monetary assets of the Company have been stated at their fair value.

In connection with the merger, Lana Pope and Dave Boulter voluntarily resigned from the board of directors of the Company on November 3, 2006.

Following such resignations, as a result of the merger, three persons became the Company's board of directors: Enrique de Vilmorin, President, Chief Executive Officer, and Director, Jose Manuel Escobedo, Director and Secretary, and Luis Willars, Director and Treasurer.

Table of Contents

A summary of the merger follows:

- The Company was the surviving legal corporation,
- The Company acquired all issued and outstanding shares of Ethos in exchange for 17,718,187 shares of common stock of the Company. Shares of Company common stock, representing an estimated 97% of the total issued and outstanding shares of Company common stock, was issued to the Ethos stockholders,
- The shareholders of the Company received pro rata for their shares of common stock of Ethos, 17,718,187 shares of common stock of the Company in the merger, and all shares of capital stock of Ethos were cancelled,
- The officers and directors of Ethos became the officers and directors of the Company,
- The name of Victor Industries, Inc. was changed to “Ethos Environmental, Inc.”, and
- Ethos requested a new symbol for trading on the Over the Counter Bulletin Board (“OTCBB”), which also reflects the reverse stock split of 1 for 1,200, the new symbol of the Company is “ETEV.”

Over the last decade, the unmatched value of *Ethos FR*[®] products has been proven through millions of miles of on-the-road testing. On average, customers have achieved a 7% to 19% increase in fuel mileage, and more than a 30% reduction in emissions.

Ethos seeks both a cleaner environment and economic success. As the name Ethos suggests, we are committed to the highest ethical standards - in the product that we sell, in the relationship with our clients, and in the conduct of our business. The Company’s approach is to sell *Ethos FR*[®] “one gallon at a time”, earning the trust and loyalty of each customer by providing products that perform as promised and make a positive difference in the world.

Products

Ethos manufactures a unique line of fuel reformulators that contain a blend of low and high molecular weight esters. Ethos products add cleaning and lubricating qualities to any type of fuel or motor oil, allowing engines to perform cooler, smoother and with more vigor. The overall benefits are increased fuel mileage, reduced emissions, and reduced maintenance costs.

Ethos fuel reformulating products increase fuel mileage and reduce emissions by burning fuel more completely. Exhaust is essentially unburned fuel, i.e. wasted fuel, so when that fuel is used more completely, the engine delivers better mileage from every tank. Efficient fuel use also improves engine performance due to the fact that a more complete combustion process obtains increased power from every engine revolution.

The management of Ethos Environmental firmly believes that the market for our product is aggressively expanding. Worldwide fuel consumption is approximately 85 million barrels per day and projected by the Energy Information Administration to continue to grow to 97 million barrels per day by 2015, and 118 million barrels per day by 2030. Much of the dramatic growth over the past decade has been fueled by the dramatic expansion of India, China and Brazil. As additional undeveloped countries begin to expand, so too will fuel consumption and the Company’s market base. In addition, consumers are becoming more sensitive to increased fuel economy as oil prices have increased eight times since the late 1990s.

Ethos products reduce fuel emissions, benefiting the environment in two notable ways:

1. The use of Ethos products reduce engine exhaust emissions by 30% or more, including measurable reductions in the emission of hydrocarbons (HC), nitrogen oxides (Nox), and carbon monoxide (CO). All of these emissions are highly toxic and detrimental to the environment.
2. Ethos products reduce emissions of particulate matter, especially in diesel-powered engines. Diesel fuel is commonly dirty and maintaining a diesel engine in the prime condition necessary to reduce emissions is both expensive and time-consuming. As a result, diesel engines are a constant source of air contaminants. In most industrialized countries, including the U.S., diesel engines are one of the largest sources of air pollution. When Ethos products are added to diesel fuel, the engine runs cleaner, smoother and cooler - significantly reducing sooty exhaust. Engines treated with Ethos run with less friction, heat and noise. Fuel and lubricating systems, filters, tanks, and injectors last longer, reducing maintenance costs.

Ethos has two products, Ethos FR® and Ethos Bunker Fuel Conditioner (“Ethos BFC”). There are two esters used in each product, a light ester and a heavy ester. For the Ethos FR®, we obtain the esters from Hatco and Cognis. The mineral oil used in the Ethos FR® is obtained, primarily, from Chevron, and, at times, from Proctor and Gamble.

Table of Contents

20

Ethos FR® can be used in any fuel. Ethos BFC is primarily used for Maritime Diesel Fuels and Power Plant Diesel Fuel, or external combustion engines. Ethos BFC uses two esters distinct from those used in the Ethos FR® as the diesel fuel used in external combustion engines is heavier and thicker than normal diesel fuel. We obtain the heavy ester for the Ethos BFC from Tekat (a Netherlands Company headquartered in the UK). The light ester is purchased from Cognis. While there is no toxicity in the Ethos FR®, Ethos BFC has some degree of toxicity, though not much.

Ethos products provide risk-free benefits with an economic gain to the client. To date, all customers have testified, either verbally or in writing, that they experienced a monetary gain on fuel savings, with all stating that they experienced an average improvement in mileage per gallon between 7% and 19%, depending on the fuel (gasoline or diesel), the vehicle used, and the individual driver's practices and driving traits.

Trademarks

We own the following trademark(s) used in this document (which is registered with the United States Patent and Trademark Office under Registration Number 3,015,561): Ethos FR®. Trademark rights are perpetual provided that we continue to keep the mark in use. We consider these marks, and the associated name recognition, to be valuable to our business.

Air Quality Standards

It is believed that with the increased worldwide focus on the greenhouse effects of petroleum products, the ability of Ethos to reduce emissions by 30% can only increase the Company's market presence. Political and media pressures are causing more people to become concerned about our environment and the effects of global warming. For example, per the National Snow and Ice Data Center in Boulder, Colorado, the ice cover in the Arctic Ocean has shattered the all-time low record during the summer months of 2007. Most researchers had anticipated the complete disappearance of the Arctic ice pack during the summer months would not happen until after the year 2070, but now believe it could happen as early as 2030.

Ethos Environmental began the manufacturing and marketing of Ethos products after ten years of successful product testing. During the early years, widespread public environmental concerns were only beginning to surface. Air quality standards were non-existent and fuel costs were low, making penetration of the market an uphill battle.

In recent years most of the improvements in air quality have come through advancements in engine technologies. Through catalytic converters and computer controlled air and fuel injection systems, engineers have designed cars that use fuel much more efficiently and pollute far less than ever before. But as new engine technologies have reached their limits, the government has turned its attention to the oil companies to produce cleaner-burning fuels.

The approach of Ethos Environmental is to sell our products "one gallon at a time", earning the respect and trust of each user. Over the past decade, our products have gone through extensive miles of road tests, with all such testing verifying the ability of our products to significantly reduce emissions while improving gas mileage. Now, at a time of skyrocketing fuel costs, the value of Ethos products is paying off for a long list of domestic customers and a growing contingent of international clients.

Market Research

Air pollution caused by cars, trucks and other vehicles burning petroleum-based fuels is one of the most harmful and ubiquitous environmental problems. Furthermore, local accumulation in heavy traffic is the greatest source of community ambient exposure, largely because carbon monoxide is formed by incomplete combustion of carbon containing fuels.

Diesel exhaust is a major contributor of particulate matter concentrations. Representing only 2 percent of the vehicles on the road, diesel powered vehicles generate more than half of the particulates and nearly a third of the nitrogen oxides in the air, according to a study by the California Air Resources Board. Air pollution monitoring efforts by the American Lung Association indicate that diesel accounts for 70% of the cancer risk. Furthermore, pioneers in the study of global warming factors have come to believe that particulate matter, such as that emitted by diesel engines, plays a far more critical role in the development of the “greenhouse effect” than previously suspected.

Table of Contents

21

To combat this problem the U.S. Environmental Protection Agency developed a two-step plan to significantly reduce pollution from new diesel engines. (New Emission Standards for Heavy-Duty Diesel Engines Used In Trucks and Buses) (October 1997, EPA 420-F-97-016). The first step set new emissions standards for diesel engines beginning in 2000. The second step sets even more stringent emission standards that will take effect in 2007, combined with mandated reductions in the sulfur levels of all diesel fuel.

As crude oil is heated, various components evaporate at increasingly higher temperatures. First to evaporate is butane, the lighter-than-air gas used in cigarette lighters, for instance. The last components of crude oil to evaporate, and the heaviest, include the road tars used to make asphalt paving. In between are gasoline, jet fuel, heating oil, lubricating oil, bunker fuel (used in ships), and of course diesel fuel. The fuel used in diesel engine applications such as trucks and locomotives is a mixture of different types of molecules of hydrogen and carbon and include aromatics and paraffin. Diesel fuel cannot burn in liquid form. It must vaporize into its gaseous state. This is accomplished by injecting the fuel through spray nozzles at high pressure. The smaller the nozzles and the higher the pressure, the finer the fuel spray and vaporization. When more fuel vaporizes, combustion is more complete, so less soot will form inside the cylinders and on the injector nozzles. Soot is the residue of carbon, partially burned and unburned fuel.

Sulfur is also found naturally in crude oil. Sulfur is a slippery substance and it helps lubricate fuel pumps and injectors. It also forms sulfuric acid when it burns and is a catalyst for the formation of particulate matter (one of the exhaust emissions being regulated). In an effort to reduce emissions, the sulfur content of diesel fuel is being reduced through the refinery process, however, the result is a loss of lubricity.

Diesel fuel has other properties that affect its performance and impact on the environment as well. The main problems associated with diesel fuel include:

- Difficulty getting it to start burning o Difficulty getting it to burn completely o Tendency to wax and gel
 - With introduction of low sulfur fuel, reduced lubrication
 - Soot clogging injector nozzles
 - Particulate emissions
 - Water in the fuel
 - Bacterial growth

Today's advanced diesel engines are far cleaner than the smoke-belching diesels of recent decades. Unfortunately, even smokeless diesel engines are not clean enough to meet current stricter air pollution regulations.

While diesel engines are the only existing cost-effective technology making significant inroads in reducing "global warming" emissions from motor vehicles, it is not sufficient to satisfy regulators and legislators. Diesel engines will soon be required to adhere to stringent regulatory/legislative guidelines that meet near "zero" tailpipe emissions, especially on smog-forming nitrogen oxides (NOx), particulate matter (PM) and "toxins"; the organic compounds of diesel exhaust.

The U.S. Department of Energy, Energy Information Administration ("EIA") estimates that worldwide annual consumption of diesel fuel approximates 210 billion U.S. gallons. A breakdown of this estimate is summarized as follows:

Table of Contents

22

Based on further EIA published data, the following table* depicts domestic distillate fuel oil consumption by energy use for 2001.

* Sources: Energy Information Administration's Form EIA-821, "Annual Fuel Oil and Kerosene Sales Report," for 1997-2001 and "Petroleum Supply Annual," Volume 1, 1997-2001. Totals may not equal sum of components due to independent rounding.

When blended with fuels, Ethos products reduce the emissions of hydrocarbons (HC), nitrogen oxides (Nox) carbon monoxide (CO), particulate matter (PM) and other harmful compounds of combustion. Given these conditions, the commercial fuels consumer market represents an important target for Ethos Environmental.

Competition

The market for products and services that increase diesel fuel economy, reduce emissions and engine wear is rapidly evolving and intensely competitive and management expects it to increase due to the implementation of stricter environmental standards. Competition can come from other fuel additives, fuel and engine treatment products and from producers of engines that have been modified or adapted to achieve these results. In addition, we believe that new technologies, including additives, will further increase competition.

Alternative fuels, gasoline oxygenates and ethanol production methods are continually under development. A number of automotive, industrial and power generation manufacturers are developing more efficient engines, hybrid engines and alternative clean power systems using fuel cells or clean burning gaseous fuels. Vehicle manufacturers are working to develop vehicles that are more fuel efficient and have reduced emissions using conventional gasoline. Vehicle manufacturers have developed and continue to work to improve hybrid technology, which powers vehicles by engines that utilize both electric and conventional gasoline fuel sources. In the future, the emerging fuel cell industry offers a technological option to address increasing worldwide energy costs, the long-term availability of petroleum reserves and environmental concerns.

Table of Contents

23

The diesel fuel additive business and related anti-pollutant businesses are subject to rapid technological change, especially due to environmental protection regulations, and subject to intense competition. We compete with both established companies and a significant number of startup enterprises. We face competition from producers and/or distributors of other diesel fuel additives (such as Lubrizol Corporation, Chevron Oronite Company, Octel Corp., Clean Diesel Technologies, Inc. and Ethyl Corporation), from producers of alternative mechanical technologies (such as Algae-X International, Dieselcraft, Emission Controls Corp. and JAMS Turbo, Inc.) and from alternative fuels (such as bio-diesel fuel and liquefied natural gas) all targeting the same markets and claiming increased fuel economy, and/or a decrease in toxic emissions and/or a reduction in engine wear.

Ethos FR® and Ethos BFC are unique, and comparative fuel reformulators do not exist. The primary task for the Company is to distinguish itself as an industry leader in the reduction of fuel costs and emission problems at a profit gain to the commercial user. Part of the challenge before us is to differentiate Ethos products from two types of products in this industry, additives - that are purported to increase fuel mileage and oxygenates - which are mandated to lower emissions. Both provide short-term benefits at the price of long-term engine or environmental problems.

Additives contain highly refined petrochemicals or compressed hydrocarbons that promise better fuel mileage and sometimes lower emissions, by “cleaning” the engine. Used mainly by individual consumers, they are expensive and commonly sold at the auto parts and retail stores. More than five thousand EPA-registered fuel additives compete in the retail market and although the EPA requires that such products be registered, that registration constitutes neither endorsement nor validation of the product’s claims.

Oxygenates, such as methyl tertiary butyl ether (MTBE) and Ethanol, are intended to lower emissions by adding oxygen to the fuel. Ethos FR® products actually complement federally mandated oxygenates by lowering emissions, but as mentioned earlier, Ethos FR® is not an oxygenate and cannot be used for the purpose of complying with current language federal legislation.

In contrast, Ethos FR® products have cleaning properties that contribute to the lubrication of the engine instead of destroying it. The ester-based formula dissolves the gums and residues and adds important lubrication that an engine needs. The engine stays clean and lubricated, allowing it to run smoothly and efficiently.

Marketing Strategy

Ethos products are ideally positioned to capitalize on increasing fuel prices and regulatory pressure to tighten emissions standards. Fuel is a significant operating cost for companies that use cars, trucks or vessel fleets in their daily business, especially where competitive markets make it difficult to pass along fuel increases. Every hike in the price of fuel hurts the profitability of that company. For these businesses, obtaining better mileage offers a crucial competitive edge, and the goal of Ethos Environmental is to help them maximize their fuel use and maintain profitability.

From its earliest days, Ethos has focused on the product demonstration as the most effective means of introducing Ethos FR® to potential users. During this demonstration phase, Ethos supplies product to treat a sample of the fleet at no cost to the client. It is vital that the customer understand and prove the effectiveness of Ethos FR® in their fleets. This demonstration phase will last as long as necessary to quantify the value and projected savings possible once the entire fleet is treated.

Through this demonstration process, we prove to each customer that they can realize the benefits of reduced emissions, smoother-running vehicles and lower maintenance costs at virtually no risk, because the reduction in fuel usage will more than cover the expense of using Ethos FR®. In fact, the addition of Ethos FR® will result in fuel savings beyond the cost of treatment, resulting in monetary gain to the user.

Commercial fleets vary in size from a few to thousands of vehicles. Such fleets generally produce immediate sales results because administrative requirements are minimal and the product demonstration phase is brief. Typically, a sample of the fleet is treated and the potential customer is quickly able to quantify the value and project the savings that the use of Ethos FR[®] will produce. Usually a fleet's oldest and dirtiest vehicles, or vehicles out of warranty, are included in the demonstration. Such vehicles amplify the effectiveness of the products and help to ease any initial client objections regarding manufacturer warranties. Once the demonstration is underway, Ethos FR[®] products sell themselves, increasing fuel mileage between 7% and 19% and reducing emissions by more than 30%. Once the effectiveness of the product has been established, a conscientious customer-service program ensures continued use.

Table of Contents

24

The Ethos Environmental strategy has been to approach each market from the perspective of the customer's strongest motivation, whether to reduce fuel costs or reduce engine emissions. From a marketing standpoint, it is most cost-effective for Ethos Environmental to focus on commercial fuel users that keep track of maintenance and operating expenses. These consumers are more sensitive to pressures from rising fuel costs and more concerned about meeting emissions standards.

Rising fuel costs will always be a marketing advantage for Ethos. Higher fuel prices decrease the cost to treat each gallon of fuel; resulting in even greater savings to Ethos clients. The Company's marketing strategy strengthens as the price of fuel increases. Even where cost savings are a client's primary motivator, the use of Ethos FR[®] identifies the user as an environmentally conscientious business. It also creates goodwill within the community through the reduction of unhealthy and unsightly exhaust emissions.

Ethos FR – Proof of Performance

An integral part of our sales process is to conduct proof of performance demonstrations for potential customers wherein we accumulate historical data that documents the effects of the use of Ethos FR[®] (i.e. advantages in terms of increased fuel economy, a decrease in engine wear and reductions in toxic emissions) on that customer's specific vehicles or vessels. In connection with the proof of performance demonstrations, we provide fleet monitoring services and forecasts of fuel consumption for purposes of the prospective customer's own analysis.

The results below are test results of customer experiences using Ethos FR[®]. The first results are for a fleet of trucks for Allied Waste. The second results are for Ecuador for Ethos BFC used in external combustion engines. On our website are results for other customers including: US Department of Justice; LA Transport; Lucar Transport; Mission Linen Supply; Vista City; China City Bus Company; Oceanside School District; San Diego Port District; and the Shenzhen Public Transport Group. In all tests the results have been consistent, with a 7% to 19% cost saving, and an over 30% reduction in emissions.

Following is a Management Report outlining the process and methodology of the testing of Ethos FR[®] for Allied Waste Services:

Table of Contents

25

MANAGEMENT REPORT

Testing of Ethos Fuel Reformulator Allied Waste Services, Southwestern Region

Overview

Ethos FR has been used, without interruption, at multiple Allied Waste locations in Southern California since the year 2001.

Based on the positive results realized at those locations (estimated at a 10% reduction in fuel consumption plus significant reductions in maintenance/repair costs and emissions) an initial test was conducted at one location in the Southwestern Region of Allied Waste during the months of July and August, 2006. The results of this initial 4 week test showed an estimated reduction in fuel consumption of 10.35%, as measured by gallons per engine hour, compared to a baseline period of the previous 12 months (July 2005 through June 2006).

Based on these positive results, a second phase of testing was initiated in May 2007 encompassing 4 locations in the Southwestern Region. The period of testing was generally the months of May, June and July 2007, however, one location continued Ethos use through August. The detailed data obtained from this testing period is content of this report.

Testing Procedures and Data Compilation & Reporting Methodology

Upon initiation of the testing period, fuel consumption and engine hour data was obtained from each location for a baseline period in order to establish a point of comparison for the test. The baseline period for each location was generally the period of January through March, 2007.

The standard CFA report obtained from each location was the "Fuel Transaction Detail by Equipment #" report. This report provides the most comprehensive daily listing of fuel dispensed and engine hours recorded for each vehicle during each time period. It is important to note that **detailed** reports were used throughout the compilation of the data contained in this analysis because every report from every location contains several "anomalies" which could distort the accuracy of any data from any report.

Most common among these "anomalies" are:

1. Vehicles showing fuel consumed but few or no engine hours recorded (which would result in a higher fuel per hour calculation than is actually the case),
2. Vehicles showing no fuel consumed yet have engine hours recorded (which would result in a lower fuel per hour calculation than is actually the case), or
3. Vehicles that do not have recorded data for both comparative periods. This would include:
 - new vehicles that have been added to the fleet (and therefore have no baseline data)
 - vehicles that have been retired from the fleet or are out of service for repairs or maintenance (these vehicles will have baseline data but no data in one or more of the test periods).

Raw Data vs. Comparable Data

Due to the frequency and significance of the anomalies outlined above, a detailed process was implemented to ensure that any such reporting inaccuracies did not undermine the validity of the comparative data obtained during this test.

Table of Contents

26

The procedures utilized by Green Fleet Associates were as follows:

1. Every CFA report that was obtained from every location for every time period as reviewed line-by-line, vehicle-by-vehicle to assure the validity of the data. Any obvious anomalies were highlighted on the raw CFA report.
2. This raw data from the CFA report was transferred to a spreadsheet in order to facilitate ongoing side-by-side, vehicle-by-vehicle comparisons of baseline to test period data. Any anomalies or missing data for any vehicle was highlighted on the spreadsheet for reach comparative period.
3. A true “apples-to-apples” comparison was obtained for each time period by removing all highlighted items.

Verification of Ethos Use

Equally important in assuring the validity of the data collected was making best efforts to verify that all of the fuel being consumed by each location during the testing period was being treated with Ethos. The method utilized to check this compliance was a detailed tracking of fuel deliveries compared the Ethos inventory at each location during the testing period. While almost all locations maintained a consistent treatment schedule throughout the three month testing period, there were some minor exceptions.

The spreadsheets detailing the baseline & test period data, for each month at each location are as follows:

Table of Contents

27

Following is a summary of the test results for Ethos Bunker Fuel Conditioner, tested at Esmeraldas, Ecuador.

- 1.) **O₂** levels increased by **41.53 %** after the application of the Ethos Bunker Fuel Conditioner.
- 2.) CO₂ levels decreased by 7.79% after the application of the Ethos BFC.
- 3.) CO levels decreased by 91.75 % after the application of the Ethos Bunker Fuel Conditioner.
- 4.) SO₂ levels decreased by 1.69% after the applications of the Ethos BFC.
- 5.) NO levels decreased by .82% after the application of the Ethos BFC.
- 6.) NO₂ levels remained constant at 0.
- 7.) Nox levels decreased by .82% after the application of the Ethos BFC.
- 8.) tf levels decreased by 9.18% after the application of the Ethos BFC.
- 9.) ta levels decreased by 1.16% after the application of the Ethos BFC.
- 10.) CO₂ max levels decreased by .69% after the application of Ethos BFC.
- 11.) Excess air readings increased by 48.14% after the application of the Ethos BFC.

28

Ethos FR – Proof of Performance Demonstrations

Ethos Environmental’s fuel reformulating products reduce emissions by burning fuel more completely, which improves fuel mileage. Exhaust is essentially unburned fuel, wasted fuel, so when the fuel is used more completely the engine delivers better mileage from every tank. Efficient fuel use also means improved engine performance because a more complete combustion process obtains increased power from each engine revolution.

In the last decade hundreds of thousands of miles in road tests have been conducted. Test after test, Ethos products have proven to reduce engine exhaust emissions by 30% and more, including measurable reductions in the emissions of hydrocarbons (HC), nitrogen oxides (NOx), carbon monoxide (CO), and sooty exhaust or particulate matter (PM). All of these emissions are highly toxic and as a result, fuel mileage increases have been significant, ranging from 7% to 19% fleet wide.

Ethos Environmental uses an opacity meter, a detection device for diesel vehicles that measures the percentage of opacity (light obstructed from passage through an exhaust smoke plume), to demonstrate dramatic reductions in emissions. In more than 1,000 heavy-duty diesel vehicles treated (a motor vehicle having a manufacturer’s maximum gross vehicle weight rating (GVWR) greater than 6,000 pounds), emissions were lowered by as much as 90%. The Society of Automotive Engineers (SAE) recommended practice SAE J1667 “Snap Acceleration Smoke Test Procedure” to be used for heavy-duty diesel powered vehicles. Attached are samples of opacity test sheets, taken from diesel-powered engines, demonstrating the positive results after using Ethos FR®.

29

Target Markets

According to the American Petroleum Institute, the United States fuels consumer market is comprised of the following segments: retail consumer 27%, government agencies 16%, ground fleets 14%, industrial users 10%, aircraft 9%, maritime 6%, miscellaneous 18%.

The Company's typical customers use cars, trucks or vessels in their day-to-day operations. Fuel is a significant operating cost, and consequently these fleets are particularly sensitive to fuel price fluctuations and strict emissions standards. The ideal clients are those with fleet managers and are conscientious about keeping track of operating expenses. They understand that every hike in fuel price hurts their profitability, this being a critical factor wherever competitive markets make it difficult to pass on the price increases to their clients; thereby making it critical for businesses to obtain better mileage as a competitive advantage.

Maritime and government agencies are desirable for their large fuel volume use and industry credibility. They offer the Company medium to long-term sales, since the process requires a longer lead-time to close. The product demonstration phase and administrative requirements are generally more complex, particularly with large government institutions. At the same time, they offer large volume sales and a continual source of staged orders that promote production stability.

Marine vessels run on bunker fuel that is less refined than diesel. A mid-size ship will use more than half a ton per hour of operation, or 125 gallons of fuel per hour. For example, a mid-size vessel running on bunker on a typical trip to Japan from Los Angeles will require a half ton per hour, or 180 tons. This represents a total of 45,000 gallons of fuel that requires 4,500 oz. (35 gallons) of Ethos BFC. This vessel would use approximately one drum (55gals.) of Ethos BFC per month. Accordingly, maritime customers represent a large and solid client base.

Countries all around the world are endeavoring to deal with the high costs of petroleum products and the detrimental effects of those products on the environment, much like the United States. The Company has found broad and enthusiastic acceptance of its Ethos products globally. During the past three years, the Company has opened markets in Asia, Latin America, Canada, Australia, Africa and Europe, often dealing directly with government entities that possess the power to implement widespread use of Ethos products – whether in citywide public transportation systems or countrywide fuel distribution structures.

As with our domestic client base, international customers of Ethos appreciate the benefits of improved mileage and reduced emissions. In countries that lack the regulatory structures necessary to control vehicle emissions and fuel efficiency, the benefits of Ethos are even more pronounced.

Customers

We have a diversified customer list. We derive revenue from our customers as discussed in Note 1, "Organization and Significant Accounting Policies: Revenue Recognition" of the financial statements. Three customers accounted for 88% of our revenues for the three months and nine months ended September 30, 2007. As our products reach more customers, the concentration of credit risk will spread out amongst the base of our clientele, and will lessen the effect of the risk shown during the period ended September 30, 2007.

Table of Contents

As shown below, the geographic concentration of risk is with companies in Central America.

- (1) Petro Industrial, an Ecuadorian company, accounted for 45.14% of revenues;
- (2) Electroguayas S.A., an Ecuadorian company, accounted for 29.77% of revenues; and
- (3) PetroEcuador, another Ecuadorian company, accounted for 13.4% of revenues.

Supply Arrangements

We presently obtain our raw materials on an exclusive basis from five (5) suppliers. However, these arrangements are not governed by any formal written contract. Accordingly, either party may terminate the arrangement at any time, including the exclusivity aspect of the arrangement. If a supplier is not able to provide us with sufficient quantities of the product, or chooses not to provide the product at all (for any reason), or if exclusivity is lost, business and planned operations could be adversely affected. Although management has identified alternate suppliers of the products, no assurance can be given that the replacement products will be comparable in quality to the product presently supplied to us by current suppliers, or that, if comparable, products can be acquired under acceptable terms and conditions.

Revenue and Fixed Assets

Our revenue is generated in the United States and abroad through our San Diego, California office, which at present is the only operating office. All of our fixed assets are located in the San Diego, California office. In February, 2007 the Company entered into a sale and leaseback arrangement as outlined below under Loan Facilities.

Vendors

The Company maintains strong relationships with all of our vendors. We are not dependent upon any one vendor for our business.

Governmental Regulation

In the United States, fuel and fuel additives are registered and regulated pursuant to Section 211 of the Clean Air Act. 40 CFR Part 79 and 80 specifically relates to the registration of fuels and fuel additives. Typically, there are registration and regulation requirements for fuel additives in each country in which they are sold. In accordance with the Clean Air Act regulations at 40 CFR 79, manufacturers (including importers) of gasoline, diesel fuel and additives for gasoline or diesel fuel, are required to have their products registered by the EPA prior to their introduction into commerce.

However, EPA registered additives are derived from petroleum while Ethos FR[®] is a reformulator. Even though you “add it” to the fuel, Ethos FR[®] is not derived from petroleum and is non-toxic and non-hazardous and therefore not subject to governmental regulations. There could be unforeseen future changes to the registration requirements under the Clean Air Act and Ethos FR[®] may have to seek registration under such new requirements. In addition, we currently sell our product outside of the United States and intend to further expand our sales efforts internationally. We may need to seek registration in other countries for the Ethos FR[®] product.

At this time the Company is not aware of any present or pending rules or regulations that would require the Company to seek registration of the Ethos FR[®] product either domestically or internationally.

Quarterly Developments

On or about August 7, 2007, the Company agreed to sell the land and building located at 6800 Gateway Park Drive located in San Diego, CA, as well as 2,500,000 shares of its common stock in exchange for \$7,875,000. The Company's Form 8-K filed on or about August 10, 2007 is incorporated by reference herein and provides additional details regarding this transaction.

Critical Accounting Policies and Estimates

We believe that there are several accounting policies that are critical to understanding our historical and future performance, as these policies affect the reported amounts of revenue and the more significant areas involving management's judgments and estimates. These significant accounting policies relate to revenue recognition, research and development costs, valuation of inventory, valuation of long-lived assets and income taxes. For a summary of our significant accounting policies (which have not changed from December 31, 2006), see our annual report on Form 10-KSB for the period ended December 31, 2006.

Income Taxes

The Company accounts for its income taxes under the provisions of Statements of Financial Accounting Standards No. 109 (SFAS No. 109). Income taxes are provided for the tax effects of transactions reported in the financial statements and consist of taxes currently due plus deferred taxes related primarily to differences between the bases of certain assets and liabilities for financial and tax reporting. Deferred taxes represent the future tax return consequences of those differences, which will either be taxable or deductible when the assets and liabilities are recovered or settled. No provision for deferred taxes is reflected in the financial statements as the valuation allowance offsets any deferred tax benefit.

The Company is liable for taxes in the United States. As of September 30, 2007, the Company does not expect to have any income for tax purposes and therefore, no tax liability or expense has been recorded in these condensed financial statements, except for the minimum tax in California amounting to \$800.

The Company estimates that it has tax losses of approximately \$18,925,000 which may be available to reduce future taxable income. Any tax loss carry forwards available expire between the years 2020 and 2026.

The deferred tax asset associated with the estimated tax loss carry forward is approximately \$7,500,000. The Company has provided for a valuation allowance as an offset against the deferred tax asset as it is unknown at this time if the asset will be utilized. Deferred tax assets must be reduced by a valuation allowance if, based upon the weight of available evidence, it is more likely than not that some portion or all of the benefit will not be realized. The Company has taken a conservative approach in that it is unknown at this time if the tax benefit from these net operating losses will ever be realized. Therefore, the entire amount of the deferred tax benefit has been reduced by a valuation allowance equal to the tax benefit.

RESULTS OF OPERATIONS FOR THE THREE MONTHS AND NINE MONTHS ENDED SEPTEMBER 30, 2007 AS COMPARED WITH THE THREE MONTHS AND NINE MONTHS ENDED SEPTEMBER 30, 2006

The following analysis of historical financial condition and results of operations are not necessarily reflective of the on-going operations of the Company.

Revenues

Edgar Filing: Ethos Environmental, Inc. - Form 10QSB

We recognized revenues of \$2,299,183 for the three months ended September 30, 2007 and \$7,596,279 for the nine months ended September 30, 2007 compared to revenues of \$ 1,546,078 and \$4,244,020 for the same periods in the prior year. For the nine months ended September 30, 2007 this represents an increase of \$3,352,259 or 79%. The primary source of revenue for the nine months ended September 30, 2007 is from the sale of *Ethos FR*® to Ecuadorean companies.

Table of Contents

34

Other components of revenue include freight and service. Freight is billed to the customer and compared to the amount of freight recorded in cost of sales, so that the Company is adequately capturing the cost of freight and billing to the client appropriately.

During the three months ended September 30, 2007, the Company continued its dramatic growth in sales to Latin America. In addition, the Company has contracted additional sales through 2007 to Africa, Latin America and Australia.

The management of Ethos Environmental firmly believes that the market for our product is aggressively expanding. Worldwide fuel consumption is approximately 85 million barrels per day and projected by the Energy Information Administration to continue to grow to 97 million barrels per day by 2015, and 118 million barrels per day by 2030. Much of the dramatic growth over the past decade has been fueled by the dramatic expansion of India, China and Brazil. As additional undeveloped countries begin to expand, so too will fuel consumption and the Company's market base. In addition, consumers are becoming more sensitive to increased fuel economy as oil prices have increased eight times since the late 1990s.

It is our goal to continue to aggressively build on our success in the domestic and international markets, offering the benefits of our products to companies and countries around the world. During 2006, our revenue base increased by 168% over 2005. Since 2004, the company has increased its revenue base by 450%, and by 573% since 2003.

The company's management is directed to continued growth with its attention focused on comparative savings in marketing and production costs. Our attention going forward is to increase market awareness of our name and the benefits provided by our product line.

Our future growth is significantly dependent upon our ability to generate sales. Our main priorities relating to revenue are: (1) increase market awareness of *Ethos FR*® product through our sales and marketing plan, (2) increase growth in the number of customers and vehicles per customer, and (3) provide extensive customer service and support.

Gross Profit

Gross profit, defined as revenues less cost of goods sold, was \$1,736,252 or 75% of sales for the three months ended September 30, 2007 and \$5,323,406 or 70% for the nine months ended September 30, 2007, compared to \$ 736,074 or 48% of sales for the three months ended September 30, 2006 and \$2,522,910 or 59% for the nine months ended September 30, 2006. In terms of absolute dollars, gross profit increased 111% for the nine months ended September 30, 2007 compared to same period in the prior year due primarily to the increasing sales of the *Ethos FR*® product. During 2006 the company experienced very high freight expenses.

Cost of sales was \$562,931 for the three months ended September 30, 2007 and \$810,004 for the three months ended September 30, 2006. Cost of sales represented 25% of revenues for the three months ended September 30, 2007. For the nine months ended September 30, 2007, Cost of sales was \$2,272,873 or 30% of sales compared to \$1,721,110 and 41% for the nine months ended September 30, 2006. The increase in cost of sales at September 30, 2006 was unusually high due to large freight expenses. In 2007 depreciation increased due to the purchase of the building in 2006.

Management continues to direct attention to increasing production efficiency and thereby reducing cost of sales as a percentage of sales. Cost of sales includes the following components: material, labor, depreciation, and freight.

Table of Contents

Operating Expenses

The Company's current operating expenses are comprised of costs associated with administration; including salaries, consulting, marketing, and legal and business development. We will incur additional operating expenses for new staff members as they are hired.

Depreciation expense incurred for the three months ended September 30, 2007 was \$66,761. The increase in depreciation is due to the purchase in 2006 of the new building. The majority of the depreciation (\$58,837) is shown in cost of sales. Production and office equipment are depreciated on a 5-year basis, and the building is depreciated on a 25-year basis. Much of the equipment was sold under a sale/leaseback transaction during the first six month of 2007, thereby reducing depreciation significantly for the current three months ended September 30, 2007 as compared to the three and six month periods ended March 31 and June 30, 2007, respectively.

Operating expenses incurred during the three months and nine months ended September 30, 2007, and September 30, 2006 are shown below. These expenses were incurred primarily in the following categories:

Description/Dates	9/30/07 Three months	9/30/07 Nine months	9/30/06 T h r e e months	9/30/06 N i n e months
Common stock – a non cash item for prior services – See Note 1	-	3,875,710	-	-
Debt extinguishment – See Note 2	-	6,646,171	-	-
Building impairment – a non cash item – See Note 4	1,550,000	1,550,000	-	-
Business consulting fees	172,475	262,887	74,278	165,426
Outside services	214,303	227,103	1,645	8,265
Office expenses, including occupancy	178,309	450,937	62,230	193,612
Depreciation (other than in cost of sales)	7,924	18,197	-	-
Research and development	-	7,500	91,893	204,552
Taxes – property, franchise and other	4,671	48,584	53	3,338
Salaries and wages	206,207	532,624	63,890	63,890
Bad debt expense	16,187	16,152	600	600
Other				7,602
Sub-total – General and Administrative	2,350,076	13,635,865	294,589	647,285
Selling expenses	163,100	433,194	123,255	593,431
Total – Operating expenses	2,513,176	14,069,059	417,844	1,240,716

Research and Development Costs

Research and development costs are charged to operations when incurred and are included in operating expenses. The amounts charged for three months ended September 30, 2007 amounted to \$0, compared to \$91,893 for the three months ended September 30, 2006. For the nine month periods ended September 30, 2007 and 2006, R&D costs totaled \$7,500 and \$204,552, respectively. All of these costs are borne by the Company. Research and development

(R&D) costs have continued to decrease during 2007 due to the completion of much of the R&D of the *Ethos FR*® product.

The company continues to strive to improve its products, packaging, etc., and develops new products for the future.

Table of Contents

36

Net Loss

The Company incurred a net loss for the three months ended September 30, 2007 of \$897,883 as compared to net income of \$147,914 for the comparable prior year period. For the nine months ended September 30, 2007, the Company incurred a net loss of \$9,065,867 as compared to net income of \$897,937 for the comparable period of the prior year. The net loss for the nine months ended September 30, 2007 is a direct result of the issuance of a Common Stock and Purchase Warrant to purchase 1,900,000 shares of the Company's common stock at a purchase price of \$2.50, as well as, the issuance of 1,651,500 net shares of common stock for cash and services. For the three months ended September 30, 2007, the net loss is a direct result of a loss impairment on the building due to the issuance of stock and simultaneous sale of the building.

The change in terms of the Note Payable during the period ended June 30, 2007 resulted in Debt Extinguishment of \$6,646,171 as calculated using the Black-Scholes methodology. The corresponding entry increased expenses and equity.

None of these transactions affected cash except for the \$2,000,000 received during the three months ended September 30, 2007 for issuance of common stock.

NON-OPERATING INCOME AND EXPENSES

Non-operating expenses increased for the nine months ended September 30, 2007 compared to the same period in 2006, as a result of the financing of the new building. Interest expense totaled \$499,252 during the nine months ended September 30, 2007 from \$393,932 for the comparable period in 2006. The interest was directly associated with the interest-only loan for \$4,750,000, related to the purchase of the new building and interest-only \$500,000 and \$700,000 working capital loans.

In addition, non-operating income increased for the nine months ended September 30, 2007 compared to the same period in 2006, due to the sale and leaseback transaction with Mazuma Capital. The Company sold assets of \$737,968 to Mazuma, and leased back these assets during the first two quarters in 2007. This transaction was treated as a sale and the Company recognized a gain upon the sale of the equipment of \$179,003 which is shown in other income. (See Loan Facilities below).

Also, for comparison purposes, there were 2,500,000 newly issued shares for cash during the three months ended September 30, 2007 (See Note 1), compared to 30,823 shares issued during the three months ended September 30, 2006.

Liquidity and Capital Resources

During the nine months ended September 30, 2007, the Company had working capital of \$10,836,726 and stockholders' equity of \$6,702,282 compared to working capital of \$49,801 and stockholders' equity of \$1,696,269 for the year ended December 31, 2006.

On September 30, 2007, the Company had \$659,306 in cash of which \$300,000 is restricted, total assets of \$13,146,764 and total liabilities of \$6,444,482, compared to \$64,867 in cash and \$300,000 in restricted cash, total assets of \$7,519,474 and total liabilities of \$5,823,205 for the year ended December 31, 2006.

The Company purchased a building in 2006. The initial term of the building loan was for a period of one year with a maturity date of January, 2007. In 2006, the note was assigned to a new note holder with reduced interest of 14% compared to the original 17%. In May, 2007 negotiations began to modify the terms of the promissory note and extend the maturity for a period of two additional years through March 31, 2009, as well as, a reduced interest rate of

Edgar Filing: Ethos Environmental, Inc. - Form 10QSB

12%. On May 23, 2007, an agreement to modify the promissory note was negotiated. Terms of the modified note include an extension to March 31, 2009, and a reduction of interest to 12%. The conversion feature was replaced with a three-year warrant to purchase up to 1.9 million shares of common stock at an exercise price of \$2.50. The warrant expires March 31, 2010. This transaction is reflected in the Form 8K which was filed May 24, 2007.

In July, 2007, the Company entered into an agreement to sell the building for a price of \$7,875,000. (See Loan Facilities Below).

We anticipate, based on currently proposed plans and assumptions relating to our operations, that our current cash and cash equivalents together with projected cash flows from operations and projected revenues will be sufficient to satisfy our contemplated cash requirements for the next 12 months. Our contemplated cash requirements for 2007 and beyond will depend primarily upon the level of sales of our products, inventory levels, product development, sales and marketing expenditures and capital expenditures.

The net loss incurred at September 30, 2007 increased due to issuance of stock for services in the amount of \$3,875,710 as reflected within the cash flow, as well as, a loss impairment on the issuance of stock related to the sale of building transaction in the amount of \$1,550,000. Debt extinguishment due to the new terms of the Note Payable affected the net loss by \$6,646,171. These were non-cash transactions that increased expenses and increased equity. In addition, depreciation expense increased due to the purchase of a building in 2006. Approximately, \$250,000 of new equipment was purchased during the nine months ended September 30, 2007. Receivables have increased significantly due to a significant growth in sales for each quarter and lack of collection of Ecuadorian receivables. Payables have increased as well due to the need for additional cost of goods materials and labor to provide product for the growth in sales. Proceeds from the sale and leaseback provided for an influx of cash, although 50% of the proceeds were held back as a security deposit. Proceeds from the sale of 2,500,000 shares of common stock provided for an influx of cash during the three months ended September 30, 2007, in the amount of \$2,000,000. In conclusion, cash increased by approximately \$300,000 for the quarter ended September 30, 2007.

Management of the Company has undertaken steps as part of a plan with the goal of sustaining the Company operations for the next twelve months and beyond. These steps include: (a) attempting to raise additional capital and/or other forms of financing; (b) controlling overhead and operating expenses; and (c) continuing to increase the sales of its fuel reformulating product. There can be no assurance that any of these efforts will be successful.

Loan Facilities

On February 7, 2007, the Company entered into an equipment lease agreement with Mazuma Capital Corp. wherein the Company agreed to a 24-month sale and leaseback arrangement for up to \$800,000 of its manufacturing equipment. The lease calls for a monthly payment based on a factor of .04125 times the average outstanding loan balance during the month. Through August 20, 2007, the company had placed property valued at \$737,968 under this lease arrangement with Mazuma Capital Corp.

The contract for this sale and leaseback of equipment was accounted for as an operating lease per SFAS 13 and 28. There is no bargain purchase option at the end of the lease, and neither the 75% nor the 90% test has been met. The title may pass back to the Company at the end of the lease; however, the lease may also be continued at the end of the 24 month period or the equipment may be retained by the lessor. The Company feels the appropriate stance is to show this as an operating lease in 2007; thereby recording the reduction of equipment, the corresponding gain, and treating the payments as lease expense.

In July, 2007, the Company entered into an agreement to sell the building for a price of \$7,875,000. As part of the property sale agreement, the purchase price was allocated as follows: \$5,875,000 for purchase of the premises and \$2,000,000 for purchase of 2,500,000 shares of common stock. This transaction resulted in a loss impairment to the building upon the issuance of the stock. Simultaneously, the Company agreed to lease back the building for a period of 15 years, starting October 1, 2007. This transaction is reflected in the Form 8K which was filed August 10, 2007.

Inflation has not significantly impacted the Company's operations.

Off-Balance Sheet Arrangements

We do not have any off-balance sheet arrangements that have or are reasonably likely to have a current or future effect on our financial condition, changes in financial condition, revenues or expenses, results of operations, liquidity, capital expenditures or capital resources that are material to our investors.

PLAN OF OPERATIONS FOR THE NEXT TWELVE MONTHS

Since inception in 2000, Ethos Environmental has grown its customer base to thousands of diverse clients on six continents worldwide, using the most effective sales tool possible – a product that works! In addition to an effective and desirable product, the company’s success also derives from the careful development and tenacious implementation of a structured “proof-of-concept” marketing strategy.

Throughout this “proof-of-concept” sales and marketing phase, gross sales for Ethos Environmental have consistently exceeded forecasts, reaching more than \$1.78 million by the end of 2005, and \$4.77 million by the end of 2006. Even more significant growth is anticipated for 2007, with sales in established markets on six continents expected to top current forecasts. Furthermore, market implementation plans anticipate growth in 2007 and beyond, leading to gross multi million sales in 2008. These projections are based on the product’s proven ability to improve fuel efficiency while reducing emissions, the Company’s proven ability to penetrate new markets and build a solid base of loyal customers, and the world’s increasing costs in the petro-economic markets.

Looking forward, marketing will constitute a significant portion of company expenditures as Ethos Environmental continues to develop sales of new ester-based fuel and engine enhancing products. We are in the process of developing new products covering areas of synthetic oils, sulfur substitutes, and varied formulations of the original *Ethos FR*® and its enhancements.

In addition, we will continue to initiate patents to cover ongoing development of a new engine design that combines past, present and state-of-the-art technologies. This new system generates rotary shaft power using only a fraction of the fuel consumed by today’s internal combustion engines, and testing has yielded power output that rivals current technologies with just a fraction of the emissions. We have great hope that this project will revolutionize power generation as we know it, significantly easing pollution from the usage of fossil fuels.

The management of Ethos Environmental is excited by the enthusiastic acceptance that *Ethos FR*® products have received - domestically and all around the world. We are proud to provide a product that is part of the solution to the high cost of fuel and the health costs of environmental pollutants. Since inception management has been focused on the development of a solid infrastructure; building relationships and establishing the foundation of a business that will continue to grow - non-stop - into the future.

Revenue Recognition

The Company recognizes revenue in accordance with Securities and Exchange Commission Staff Accounting Bulletin No. 104 (“SAB 104”), “Revenue Recognition in Financial Statements”. Revenue consists of the sale of products and is recognized only when the price is fixed or determinable, persuasive evidence of an arrangement exists, the product is shipped, and collectability is reasonably assured.

ITEM 3. CONTROLS AND PROCEDURES

(a) *Evaluation of Disclosure Controls and Procedures:*

Our President and Chief Financial Officer, after evaluating the effectiveness of our “disclosure controls and procedures” (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)), have concluded that, as of September 30, 2007 due to the material weaknesses in our internal control over financial reporting identified in our 2006 Form 10-KSB, our disclosure controls and procedures were not effective in providing reasonable assurance that information we are required to disclose in reports we file is recorded, processed, summarized and reported within the periods specified.

(b) *Management’s Annual Report on Internal Control Over Financial Reporting:*

While we have continued our efforts to address each of the material weaknesses identified in our 2006 Form 10-KSB, there were no material changes in our internal control over financial reporting during the most recently completed quarter. We have not identified any additional material weaknesses during this quarter. We are not planning to report on whether there has been full remediation of the identified material weaknesses until our 2007 report on internal control over financial reporting is complete.

(c) *Changes in Internal Control Over Financial Reporting:*

There were no changes in our internal control over financial reporting during the three months ended September 30, 2007 that have materially affected, or are reasonably likely to materially affect our internal controls over financial reporting.

During 2007, the company will be directing concerted focus to full compliance with Sarbanes-Oxley requirements, as revised in Audit Standard No. 5 for small businesses, in implementing Section 404(a) of the Act.
